## **Abstract**

Analyses of FIMS data are updated to include data for the 2015/16 season, which are available for the Cape Point region only. Results indicate a slight decrease in the abundance index compared to the previous season.

## **Introduction**

In this paper the FIMS relative abundance indices for rock lobster, the FIMS length composition data and the percentage of females as reported in Brandão and Butterworth (2015) are updated to include FIMS data for the 2015/16 season for Cape Point.

## **Data and Methodology**

Data from the FIMS surveys carried out over the period 1992/93 to 2015/16 for Cape Point are available for analysis.

## **Relative Abundance Indices**

The overall CPUE index is the combination of the weighted mean CPUE (as a proportion of the total area surveyed) for each stratum (where stratum here reflects whether a station is within the 100 m contour (shallow), within the 100 to 200 m contour (deep), or if it lies within a “Hotspot”). The weighted mean CPUE for each stratum is given by the average of the weighted mean CPUE for each leg in that stratum. A full description of the methodology of the FIMS analysis to obtain relative abundance indices is given in Brandão and Butterworth (2009).

For the 1997/98 and the 2005/06 seasons, there was only one station in one of the Hotspot strata in one of the legs. The standard deviation ( $\sigma_{y,z,t}$ ) for these two records was estimated as the average of the observed (and computable) standard deviations or CVs for that stratum. The choice between using the average of standard deviations or the average of the CVs was based on which measure was steadier over the years.

The 1999/00 FIMS data point is based on only a single leg (leg 2) as the first leg was not conducted. In the 2011/12 season there were no observations for the second leg of the Deep and one of the Hotspot strata. Therefore for these strata, means and standard deviations are based on a single leg.

### **Length composition and percentage of females**

Brandão and Butterworth (2010) presented a method for obtaining length distributions whereby proportions are weighted and adjusted for small sample sizes. This method provides more appropriate length distributions in that the variation in the effort across stations, the variation in the area that each station represents and the effect of small sample sizes are all taken into account. They also presented a method to obtain annual percentage numbers of females that are weighted by area and adjusted for small sample sizes. These methods have been used in the analyses presented in this paper to obtain length distributions and annual percentages of females for rock lobster.

## Results

Table 1 reports the FIMS CPUE indices for rock lobsters for the Cape Point region measuring more than 60 cm carapace length, together with their standard errors. Note that the standard error for the 2014/15 season has been corrected from that given in Brandão and Butterworth (2015). Figure 1 shows these indices together with 95% confidence intervals, calculated given an assumption of distributional lognormality. There is a decrease in the 2015/16 estimate compared to that for the previous season, but this remains appreciably higher than the estimates since the 2000's, except for the high estimate for the 2012/13 season.

Table 2 gives the length distributions of rock lobsters for the Cape Point region, with Tables (a) giving those for males, while Tables (b) give those for female rock lobsters. Figure 2 show the length distributions of rock lobsters for males and females.

Table 3 and Figure 3 give the estimates of the annual percentage female rock lobsters for the Cape Point region. The percentage of females in the last season has increased around Cape Point and is the highest value for the whole series.

**Table 3.** Percentages of female west coast rock lobster for the Cape Point region.

<b>Year</b>	<b>Cape Point</b>
<b>1992/93</b>	24.49
<b>1993/94</b>	27.46
<b>1994/95</b>	24.16
<b>1995/96</b>	25.24
<b>1996/97</b>	21.70
<b>1997/98</b>	29.64
<b>1998/99</b>	30.77
<b>1999/00</b>	17.21
<b>2000/01</b>	21.68
<b>2001/02</b>	22.85
<b>2002/03</b>	17.63
<b>2003/04</b>	20.69
<b>2004/05</b>	22.94
<b>2005/06</b>	23.78
<b>2006/07</b>	27.45
<b>2007/08</b>	29.17
<b>2008/09</b>	23.72
<b>2009/10</b>	23.44
<b>2010/11</b>	12.68
<b>2011/12</b>	19.30
<b>2012/13</b>	23.39
<b>2013/14</b>	22.95
<b>2014/15</b>	27.86
<b>2015/16</b>	34.93

**Figure 1.** FIMS CPUE series (with 95% confidence intervals) for the Cape Point region. In this plot the period shown as 1993 corresponds to the 1992/93 season, and so on.

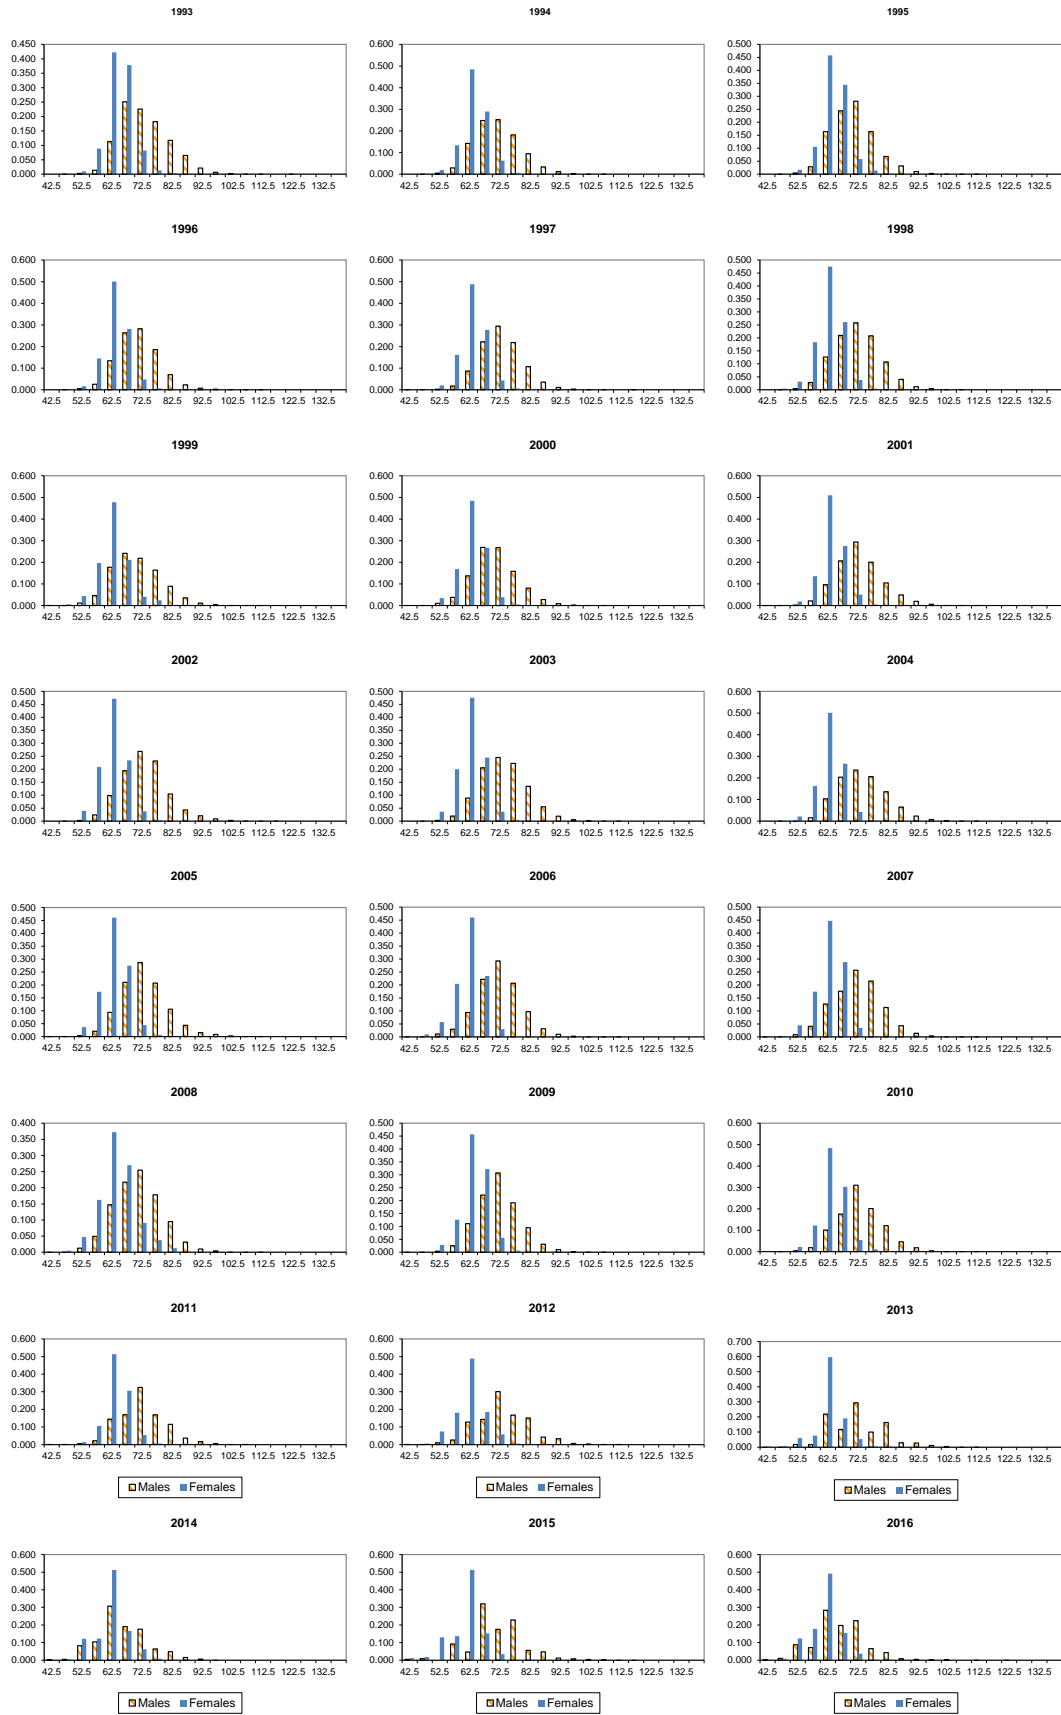

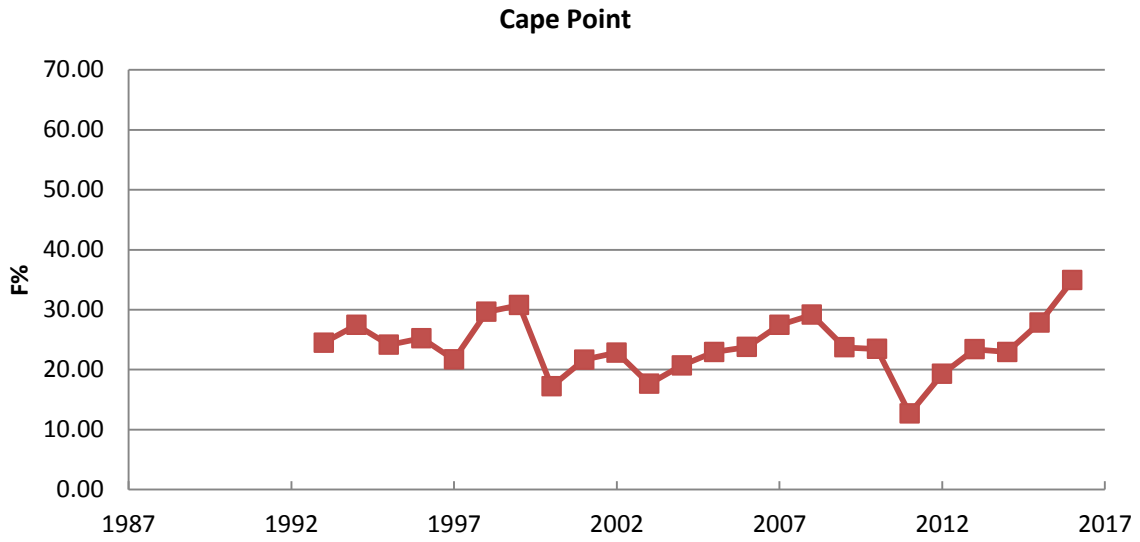

Figure 2. Length distributions of male and female rock lobsters for the Cape Point region.

**Figure 3.** Percentage female rock lobsters to be used in the population assessment model for the Cape Point region.
